

# Operation Manual

**Goodrive100-01 Series Inverter**  
**Special for PV Water Pumps**

SHENZHEN INVT ELECTRIC CO., LTD.

## Preface

Goodrive100-01 special inverters are developed for the power supply of water pumps based on the core control algorithm of Goodrive high performance inverters and the control requirements of PV water pumps. All series products apply Infineon power modules. The function of Maximum power tracking, dormant at weak light, wake up at strong light, high water level dormant, underload pre-warning and other control protection functions can ensure normal operation of water pumps according to the customers' requirements to switch to the grid power supply.

Please refer to this manual and the manual of Goodrive100 to commission the inverter.

If the product is ultimately used for military affairs or manufacture of weapon, it will be listed on the export control formulated by **Foreign Trade Law of the People's Republic of China**. Rigorous review and necessary export formalities are needed when exported.

Our company reserves the right to update the information of our products.

|           | Temperature of the running environment | -10~50℃, derate above 40℃                                                                                                                  |
|           | Average non-fault time                 | 2 years (25℃ ambient temperature)                                                                                                          |
|           | Protective degree                      | IP20                                                                                                                                       |
|           | Cooling                                | Air-cooling                                                                                                                                |
|           | Braking unit                           | Embedded                                                                                                                                   |
|           | EMC filter                             | Built-in C3 filter: meet the degree requirement of IEC61800-3 C3<br>Optional external filter: meet the degree requirement of IEC61800-3 C2 |

## 1.2 Name plate

**Note:** Above is an example of name plates of Goodrive100-01 standard products. CE/TUV/IP20 will be marked on the name plate according to actual certifications.

## 1.3 Model instruction

The model instruction contains information on the inverter. The user can find the model code on the type designation label attached to the inverter or the simple name plate.

## 2 Function parameters

For the convenience of function codes setting, the function group number corresponds to the first level menu, the function code corresponds to the second level menu and the function code corresponds to the third level menu.

1. Below is the instruction of the function lists:

**The first column** "Function code": codes of function parameter group and parameters;

**The second column** "Name": full name of function parameters;

**The third column** "Detailed illustration of parameters": detailed illustration of the function parameters;

**The forth column** "Default": original factory settings of the parameters;

**The fifth column** "Modify": the modifying character of function codes (the parameters can be modified or not and the modifying conditions), below is the instruction:

"○": means the set value of the parameter can be modified on stop and running state;

"⊙": means the set value of the parameter can not be modified on the running state;

●": means the value of the parameter is the real detection value which can not be modified;

◆": means the function code is hidden.

(In order to avoid mistakes, the modify attribute of each parameter is limited by the inverter)

### 2.1 Parameters of common functions

| Function code                         | Name               | Detailed illustration of parameters                                                                                                                                                                                                          | Default | Modify |

**Remark:**

- 1. The time when the inverters operated to the lower limit of PI output frequency after starting is determined by the ACC time.**
- 2. The instruction of delay time. If various delay conditions such as weak light, full water, and underload are met, the inverter will count the delay time respectively. After the separated delay time is arrived, it will report pre-warning and others are still kept. If the pre-warning is restored, but other conditions for delay are still existent, it will count after the precious time. So if the some pre-warning condition is not met, the pre-warning time will be cleared.**

## 3 Commissioning guide

### 3.1 Wiring and commissioning steps

#### 3.1.1 Commissioning steps during power supply

1. Wire according to the diagram and check the wiring is correct or not and then switch on

Q2.

2. Set the motor parameters

(a) Set P00.18=1 and restore to the factory settings.

(b) Set P00.01=0 and change the command to keypad control.

(c) Set the name plate of the motor, including P02.01, P02.02, P02.03, P02.04 and P02.05 (remember to press "ENT" after setting).

3. Detection of water yield for water pumps

Set the lower limit of output frequency P00.05=6.00Hz, stop mode P01.08=1 and coast to

stop.

And then, set P15.00=1 to enable the special functions for water pumps, click "Run" key and the default mode is MPPT, observe the running frequency and water yield. If the operation frequency or water yield is low at normal light, the motor wires may be reserved, so it is necessary to exchange the wiring.

#### 4. PI adjustment to the water yield

If the user requires large or low water yield, it is necessary to adjust PI (P15.06~P15.10) properly. The bigger PI parameters, the stronger the effect is, but the frequency fluctuation of the motor is bigger; in reserve, the lower the water yield is, the more stable the motor frequency is.

#### 5. Commissioning of MPPT speed tracking

P15.23 and P15.24 is the minimum and maximum voltage of the power tracking in MPPT mode. If the voltage range is smaller, the faster the tracking is. But the bus voltage in normal operation needs to be in the range; otherwise the maximum power can not be tracked. Generally:

(a) If the rated motor voltage is 415V, P15.23=520(minimum reference voltage), P15.24=600(maximum reference voltage).

(b) If the rated motor voltage is 380V, P15.23=500(minimum reference voltage), P15.24=550(maximum reference voltage).

(c) If the rated motor voltage is 220V, P15.23=270(minimum reference voltage), P15.24=330(maximum reference voltage).

Above settings are only for reference and can be adjusted according to the actual applications or by automatic adjustment. P15.26 is used to adjust the time between the maximum voltage and minimum voltage of MPPT and can be used with P15.27 to adjust the maximum and minimum reference voltage. The upper limit of maximum reference voltage can not exceed the maximum setting value of P15.28.

#### 6. Fault setting and reset time setting of fault delay

If the pre-warning of weak light, full water and underload are needed, it is necessary to set the detection point, delay time and reset time according to the actual working. Full water/no water settings are P15.11~P15.14; the function settings of underload are P15.16~P15.19; the function settings of weak light are P15.20~P15.21. Default settings

can be used, too.

## 7. Parameters setting after normal operation

If the water yield is normal and the system operation is stable, the commissioning is finished. Set P00.01=1, switch to terminal mode and set P01.18=1, P01.21=1 and P08.28=5.

**Note:** 0.85 of P11.01 corresponds to 460V. The coefficient can be modified, but can not be modified to below 0.41 (0.41 corresponds to undervoltage point 220V, so it may report undervoltage fault if the actual bus voltage is less than the value).

## 3.1.2 Commissioning steps during grid power supply

1. Wire according to the diagram and check the wiring is correct or not

Switch off Q2 and then switch on Q1.

2. After the power frequency, commission the system according to steps 2, 3, 4, 6 and 7 mentioned in 3.1.1.

3. Set P5.02=43 and then switch on S2 (or set P15.01=0) to enable the PV voltage reference.

4. Observe the bus voltage and set P15.02 to ensure the value is less than the bus voltage during operation. The bigger the value is, the bigger the water yield is. It is recommended to use the voltage value which is 20~30V less than the bus voltage in normal operation.

5. Switch off Q1 and S2 and switch on Q2 to switch to PV power supply.

**Note: If there is no diode protection at the bus input, Q2 and Q1 can not be switched on at the same time, otherwise, damage may occur to the battery board.**

## 4 Fault instruction

### 4.1 Common faults and solutions

| Fault code | Fault type                               | Possible cause                                                                                                                                                                                                                                                                                    | Solutions                                                                                                                                                                                                                                                                                                                   |

The products are owned by **Shenzhen INVT Electric Co., Ltd.**

Two companies are commissioned to manufacture: (For product code, refer to the 2nd/3rd place of S/N on the name plate.)

**Shenzhen INVT Electric Co., Ltd.** (origin code: 01)

Address: 4# Building, Gaofa Industrial Park, Longjing,  
Nanshan District, Shenzhen, China

**INVT Power Electronics (Suzhou) Co., Ltd.** (origin code: 06)

Address: 1# Kunlun Mountain Road, Science & Technology Town,  
Gaoxin District, Suzhou, Jiangsu, China

**Industrial Automation:** ■ Frequency Inverter ■ Servo & Motion Control ■ Motor & Electric Spindle ■ PLC

■ HMI ■ Intelligent Elevator Control System ■ Traction Drive

**Electric Power:** ■ SVG ■ Solar Inverter ■ UPS ■ Online Energy Management System
